

42. A computer-aided-learning system for helping a student study materials on a subject comprising:

a non-intrusive sensor configured to monitor automatically more than once a concentration-sensitive behavior of the student while the student should be studying materials on the subject;

so that the monitored results can be analyzed to provide an indication on the student's concentration level, where monitoring more than once increases the accuracy of the indication;

such that the behavior can be monitored with the sensor detached from the student.

43. A computer-aided-learning system for helping a student study materials on a subject comprising:

a non-intrusive sensor configured to monitor a concentration-sensitive behavior of the student while the student should be studying materials on the subject;

a controller configured to react, in view of the student's concentration level determined from the monitored results, so that the reaction can enhance the student's concentration level in studying materials on the subject.
